ANOVA – Analysis of Variance

Hypotheses of One-Way ANOVA

- $H_0: \mu_1 = \mu_2 = \mu_3 = \cdots = \mu_c$
 - All population means are equal
 - i.e., no treatment effect (no variation in means among groups)
- H_1 : Not all of the population means are the same
 - At least one population mean is different
 - i.e., there is a treatment effect
 - Does not mean that all population means are different (some pairs may be the same)

The F-distribution

A ratio of variances follows an F-distributi 2

$$\frac{\sigma_{between}^2}{\sigma_{within}^2} \sim F_{n,m}$$

- The F-test tests the hypothesis that two variances are equal.
- F will be close to 1 if sample variances are equal. $H_0: \sigma_{between}^2 = \sigma_{within}^2$

$$H_a:\sigma_{between}^2 \neq \sigma_{within}^2$$

Sum of Squares Within (SSW) (or SSE, for chance error)

Sum of Squares Between (SSB), or Sum of Squares Regression (SSR)

Overall
mean of all
40
observation
s ("grand
mean")

$$\overline{\overline{y}}_{\bullet\bullet} = \frac{\sum_{i=1}^{4} \sum_{j=1}^{10} y_{ij}}{40}$$

$$(\overline{y}_{i \cdot -\overline{y}_{i}})^{2}$$

$$10 \times \sum_{i=1}^{4} \qquad \longleftarrow$$

Sum of Squares
Between (SSB).
Variability of the
group means
compared to the
grand mean (the
variability due to the
treatment).

Total Sum of Squares (SST)

$$\sum_{i=1}^{4} \sum_{j=1}^{10} (y_{ij} - \overline{\overline{y}}_{\bullet \bullet})^2$$

Total sum of squares(TSS).
Squared difference of every observation from the overall mean. (numerator of variance of Y!)

Partitioning of Variance

$$\sum_{i=1}^{4} \sum_{j=1}^{10} (y_{ij} - \bar{y}_{i\bullet})^{2} + \sum_{i=1}^{4} (\bar{y}_{i\bullet} - \bar{\bar{y}}_{\bullet\bullet})^{2} = \sum_{i=1}^{4} \sum_{j=1}^{10} (y_{ij} - \bar{\bar{y}}_{\bullet\bullet})^{2}$$

| 72 | 63 | 59 | 60 |
| 71 | 65 | 64 | 65 |

Example

Step 1) calculate the sum of squares between groups:

Mean for group 1 = 62.0

Mean for group 2 = 59.7

Mean for group 3 = 56.3

Mean for group 4 = 61.4

| Treatment 1 | Treatment 2 | Treatment 3 | Treatment 4 |

| Total | 39 | 2257.1 | _ | _ | - |

INTERPRETATION of ANOVA:

How much of the variance in height is explained by treatment group?

Coefficient of Determination

$$R^2 = \frac{SSB}{SSB + SSE} = \frac{SSB}{SST}$$

The amount of variation in the outcome variable (dependent variable) that is explained by the predictor (independent variable).

^a School 1 (most deprived; 40% subsidized lunches).

FROM: Gould R, Russell J, Barker ME. School lunch menus and 11 to 12 year old children's food choice in three secondary schools in England-are the nutritional standards being met? *Appetite*. 2006

^b School 2 (medium deprived; <10% subsidized).

^c School 3 (least deprived; no subsidization, private school).

^d ANOVA; significant differences are highlighted in bold (P<0.05).

Answer

Step 1) calculate the sum of squares between groups:

Mean for School 1 = 117.8

Mean for School 2 = 158.7

Mean for School 3 = 206.5

Grand mean: 161

$$SSB = [(117.8-161)^2 + (158.7-161)^2 + (206.5-161)^2] x25 per group = 98,113$$

Answer

Step 2) calculate the sum of squares within groups:

S.D. for
$$S1 = 62.4$$

S.D. for
$$S2 = 70.5$$

S.D. for
$$S3 = 86.2$$

Therefore, sum of squares within is:

$$(24)[62.4^2 + 70.5^2 + 86.2^2] = 391,066$$

Answer

Step 3) Fill in your ANOVA table

| Source of variation | <u>d.f.</u> | Sum of squares | Mean Sum of Squares | F-statistic | <u>p-value</u> |
|---------------------|-------------|----------------|------------------------|-------------|----------------|
| Between | 2 | 98,113 | 49056 | 9 | <.05 |
| Within | 72 | 391,066 | 5431 | | |
| Total | 74 | 489,179 | | | |

**R²=98113/489179=20%
